The invention comprises the amino acid and coding sequences of the human cholesteryl ester transfer protein (CETP), the invention also comprises boylmorphisms identified within the CETP gene. The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA sequence represents an allele specific extension PCR primer for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New CD-39-like polypeptides and polynucleotides, useful in chromosome and gene mapping, as molecular weight markers, as food supplements, or as anti-thrombotic or anti-tissue graft rejection agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD39-like protein; gene mapping; molecular weight marker;

        The invention relates to novel CD39-like polypeptides (CD39-like nucleotide triphosphatase; NTPase) and nucleic acid molecules encoding such polypeptides. CD39-like polymucleotides may be used as hybridisation probes, PCR primers and in chromosome and gene mapping. Polypeptides of the invention may be used as molecular weight markers, as food supplements, in generating an antibody that specifically binds the polypeptide, as anti-thrombotic or anti-tissue graft rejection agents, or for regularing APP neurotransmission in smooth muscle, peripheral ganglia or brain. Sequences of the invention are useful in modulating ecto-ATPase activity and for identifying compounds that modulate ecto-ATPase activity. The present sequence is human CD39-like gene consensus translation initiation site. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated CD39LA polypeptide and polynucleotide, useful for preventing, treating, or ameliorating multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, or graft-versus-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to CD39-like polypeptide and its encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           consective tissue disease, multiple sclerosis; connective tissue disease, multiple sclerosis; systemic luque erythematosus; rheumatoid arthritis; autoimmune pulmonary inflammation; Guillain-Barre syndrome; autoimmune thyroiditis; insulin dependent diabetes mellitus; myasthenia gravis; graft-versus-host disease; allergic disorder; asthma; respiratory disorder; myeloid or lymphoid cell deficiency; periodontal disease; tooth repair process; inflammatory bowel disease; cohn repair process; inflammatory bowel disease; cohn repair process; inflammatory bowel disease; cohn sieses; leukaemia; nervous system disorder; anticoagulant; food supplement; anti-tissue graft rejection; ATP neurotransmission;

polynucleotide. The invention is useful for preventing, treating or amellorating autoimmune deficiency disorders including connective tissue disease, multiple sciencists, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune thyroiditis, insulin dependent diabetes mellitus, myasthenia gravis, graft-versus host disease or autoimmune inflammatory eye disease, allergic disorders including asthma and other respiratory problems, myeloid or lymphoid cell deficiencies, periodontal diseases and other tooth repair processes, inflammatory conditions including inflammatory bowel disease and crohn's disease, leuksemias and nervous system disorders. The invention is also useful as an anti-coagulant for inhibiting platelet aggregation, food supplement, anti-tissue graft rejection agents, for regulating neurotransmission by ATP in smooth muscle, peripheral ganglia or brain and in gene therapy. The present sequence is a human CD39L2 gene consensus translation initiation site. This sequence is used in the exemplification of the invention.

The present invention provides novel CD39-like polypeptides (CD39-like nucleotide triphosphatase; NTPase) and their encoding polynucleotides. Connucleotide triphosphatase; NTPase) and their encoding polynucleotides. The invention is useful in treating cancer, leukaemia and related disorders such as acute lymphocytic leukaemia, acute myelocytic leukaemia and chronic leukaemia, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, quillainn Barre syndrome, insulin dependent diabetes continuated arthritis, quillainn Barre syndrome, insulin dependent diabetes and litus, myasthenia gravis and graft-versus-host disease, allergic disorders such as septic shock, speremic inflammatory response syndrome (SIRS) and Crohn's disease, central and peripheral nervous system disorders such as ischaemia, Parkinson's disease, Alzheimer's disease, Huntington's chorea, systemic lupus erythematosus, human immunodeficiency virus-associated myelopathy and transverse myelopathy and nutritional disorders such as alcohol amblyopia and Marchiafava-Bignami disease. The invention also has chaemostatic and thrombolytic activity, serve as nutritional supplements and modulates ecto-ATPase activity. The invention acts as a cytostatic agent and is useful in immunotherapy. The present sequence is human consensus translation hitiation site. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
New antibody or its fragment that specifically binds to CD39L3 polypeptide, useful for detecting and purifying CD39L3 polypeptide, for treating leukemia, and for detecting and preventing metastatic spread of cancerous cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Measuring the expression or activity of a CYP enzyme in a subject by measuring the expression of the CYP enzyme gene or mRNA expression for the CYP enzyme in whole blood and normalizing the measured CYP enzyme gene or mRNA expression.

WPI; 2004-604340/58.

```
The invention relates to a novel method for measuring the expression or activity of a CYP (cytochrome P450), NAT1 (N-acetyltransferase 1) or NAT2 (N-acetyltransferase 2) enzyme in a subject comprising measuring the expression of the enzyme gene or mRNA in whole blood and normalising the measured enzyme gene or mRNA in whole blood and normalising the measured enzyme gene or mRNA expression, respectively. The method may be useful in measuring the expression or activity of an enzyme in a subject and for detecting and quantifying the presence of SNPs (single nucleotide polymorphisms) within an enzyme. Thus, the method of the invention may be utilised in order to predict the effectiveness or safety of a drug therapy, since the drug metabolising capability of an individual is affected by the isoenzymes present within that individual. The current sequence is that of a Cy3-labelled probe which was used to detect human NAT-2 wild-type DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CD39-like protein; gene mapping; food supplement; ecto-ATPase activity; gene therapy; multiple sclerosis; rheumatoid arthritis; autoimmune thyroiditis; diabetes mellitus; myasthenia gravis; autoimmune inflammatory eye disease; osteoporosis; osteoarthritis; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; leukaemia; nervous system disorder; neuroprotective; antiarthritic; antirhyroid; immunosuppressive; antidiabetic; muscular-gen; ophthalmological; osteopathic; nootropic; antiparkinsonian;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated CD39L4 polynucleotide, useful for preventing, treating, or ameliorating multiple sclerosis, rheumatoid arthritis, diabetes, osteoporosis, Alzheimer's disease, amyotrophic lateral sclerosis, or leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human CD39L2 gene consensus translation initiation site #2.

The invention also relates to a method for making CD39 proteins. The methods and compositions of the invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CD39-like polypeptide, such as HIV infection, hepatitis, multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, Guillain-Barre syndrome, thyroiditis, diabetes, myasthenia gravis, graft-versus-host disease (GHVD) and asthma. The present sequence is the human CD39L2 gene consensus translation
in the recombinant production of protein, and in generation of antisense DNA or RNA. The protein of the invention is used as molecular weight markers, and as food supplements and for modulating ecto-ATPase activity and for identifying compounds that can be utilised for modulating ecto-ATPase activity. The invention is useful for preventing, treating or ATPase activity. The invention is useful for preventing, treating or amedical condition, e.g. multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, diabetes mellitus, myasthenia gravis, autoimmune inflammatory eve disease, osteoporosis, osteoarthritis, autoimmune inflammatory even disease, amyotrophic lateral sclerosis, leukaemia or nervous system disorders and in gene therapy. The present sequence is the human CD3912 gene consensus translation initiation site. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated CD39L3 polypeptide and polynucleotide, useful for diagnosing, preventing or treating HIV, hepatitis, multiple sclerosis, systemic lupus erythematosus, arthritis, diabetes and asthma.
                                                                                                                                                                                                                                                                                                                                                                          Gapa

This invention relates to a novel isolated antibody or antigen-binding fragment that specifically binds to a human CD39L2 polypeptide comprising a fully defined 45c amino acid sequence (SEQ ID No:2) as given in the specification. In particular, it refers to the cloning and characterization of CD39-like nucleotide triphosphatases (NTPasses) and a hybridoma that produces the monoclonal antibody that can bind to the CD39L2 protein or an immunologically reactive fragment thereof. The present invention describes other CD39-like genes that can be used in various molecular biology techniques including gene mapping and in situ typridization for DNA defection. In addition, the encoded CD39-like as well as those with ADPase activity are useful as anticoagulants, for inhibiting platelet aggregation, anti-tissue graft rejection agents and con as part of methods for regulating neurotransmission by ATP in smooth muscle etc. This oligonucleotide is a human CD39L4 RNA initiation site that shares a poor consensus with the vertebrate consensus site of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antibody or antigen binding fragment that specifically binds to CD39L2 polypeptide, useful for detecting CD39L2 polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an antibody or its antigen binding fragment which specifically binds to a CD39L4 polypeptide. The invention is useful for treating some forms of cancer, where abnormal expression of the CD39L4 is involved and for detecting and preventing metastatic spread of a cancerous cells. The invention is also useful for immuno-affinity outfification of the proteins and to identify cells or tissues in which a fragment of the CD39L4 polypeptide is expressed. The present sequence is the human CD39L2 consensus translational intiation site.

```
The invention relates to a new isolated CD39L3 polypeptide, having phosphohydrolase activity, and comprising a 529-amino acid sequence, thilly defined in the specification AD274435. The polypeptide is useful in preparing a composition for treating disorders or diseases, e.g., bacterial, viral or fungal infection, cancer, osteoporosis or autoimmune disorders, or can be used to stimulate immune function. They may also be useful for wound healing and tissue repair. They may be used in the treatment of burns, incisions and ulcers. They may be used in the treatment of burns, incisions and ulcers. They may be used in the treatment of burns, incisions and ulcers. They may be used in the treatment of siseases of the peripheral nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy Drager syndrome. They are also useful in the treatment of spinal cord disorders and stroke. The protein may be useful as a fertility inducing therapeutic. The polypeptide may also exhibit hemostatic or thrombolyric activity, and antilifiammatory activity. The purified polypeptides can be used in in vitro binding assays to identify molecules which bind to the polypeptides. The polypeptides can be used in a panel or funlity proteins for high-throughput screening, to raise antibodies or to elicit another immune response, as a reagent (including the labeled reagent) in assays designed to quantitatively determine levels of the which the corresponding protein is preferentially expressed, and to which the corresponding protein is preferentially expressed, and to untritional sources or supplements. The current sequence represents a nutritional sources or supplements. The current sequence represents and protein the corresponding protein is preferentially expressed, and to nutritional sources or supplements. The current sequence represents and protein the corresponders or lagands.

The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for: identifying markers of skin ageing and/or stress; and identifying or determining the effects of skin ageing and/or stress; and identifying or determining the effects of spharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory; cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST; expressed sequence tag, ss.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to take used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchipyesis, atopic dermatitis, acne, seborrhea; lupus erythematosus; rosaces, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,

(M1) is useful for identifying genes involved in skin homeostasis, to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis; atoppic dermatitis; acne, seborrhea; lupus expthematosus; rosacca; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                            The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

The present sequence is that of a DNA helper probe, designated hj-DNA 11'mer as 5' end. This helper probe was used in an example from the invention in which linked nucleic acid (LNA) helper probes were used to improve the capture of single-stranded DNA targets by immobilised anthraquinone-coupled LNA capture probes. This is an example of a method for enhancing hybridisation of a capture oligonucleotide to a target. The method exhibits significantly improved binding abilities, and is particularly suited for detection of single nucleotide polymorphism sites, for genotyping and diagnosis of genetic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting a nucleotide target sequence for detecting genetic disease, by

                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression ($AGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes and quantify their expression of determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis, atopic dermatitis, acne, seborrhea; lupus erythematosus; rosaces; melanoma; basal call carcinoma; a lupus erythematosus; rosaces; melanoma; basal call carcinoma; a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic;

This is an example of a method for enhancing hybridisation of a capture oligonuclectide to a target sequence using a helper probe comprising modified nucleotide residues. The method exhibits significantly improved binding abilities, and is particularly suited for detection of single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                        Detecting a nucleotide target sequence for detecting genetic disease, by using a helper probe.

```
This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises the ecovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to serial analysis of gene expression to breast and subjecting the mixtures for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are in vitro method for determining homeostasis of human facial skin; a test can biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or dentification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                          In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to scrial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes an in vitro method for determining homeostasis of human facial skin, a test kit which comprises a solid support (flexible or rigid) on which are immobilised probes that bind specifically to the factors of interest and a binding decompless of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identifying cosmetic and pharmaceutical agents. The method allows identification of as many as possible of the genes important for facial comments of the invente or the engage of the genes important for facial comments.
                                                                                                     In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are timmobilised probes that bind support (flexible or rigid) on which are a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                   cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identifying cosmetic and pharmaceutical agents. The method allows identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                    In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a method of analyzing haplotype, by detecting gene polymorphism in drug-related genes such as aryl acetylamide deacetylase, arylalkylamine N-acetyl transferace or ATP-binding cassette, deacetylase, arylalkylamine N-acetyl transferace or ATP-binding cassette, and feamily A (ABCI), member 1. The method is useful for analyzing cassette, haplotype. The method is useful for estimating the sensitivity or disease of preventing or treating disease, for determining appropriate dosage of medicine for preventing or treating a disease, for analyzing a drug interaction, and for determining the related polymorphism relative to the medicine for preventing or treating a disease, for analyzing a drug interaction, and for determining the related polymorphism relative to the diseases. In medicine, foreign material or disease, metabolic disease, kidney disease, respiratory disease and muscle associated disease. The method enables analysis of the individual differences calated to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence represents a human SNP detection related oligonucelotide.
                                                                Analyzing haplotype, by detecting polymorphism in drug-related genes, electing common polymorphism (CP), building haplotype block using CP, specifying CP within block, specifying tag polymorphism from CP within
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ٠.

New anti:sense oligo:nucleotide(s) for inhibiting HSV - also used for diagnosis and for inhibiting HIV activation by herpes virus.

(UYMA-) UNIV MARYLAND BALTIMORE,

UNIV JOHNS HOPKINS

(07.70)

MPI, 1992-132145/16.

Aurelian L, Tso P;

```
The sequence is that of an antisense oligonucleotide which can be used for inhibiting growth or replication of herpesviruses. It corresponds to an antisense sequence of a herpesvirus site, pref. in a gene that is essential for synthesising nucleic acids e.g. the immediate early genes or Vmw65. It can be prepd. by solid phase triester or phosphor-amidite chemistry or by recombinant DNA techniques. It can be used for treating infection by herpesviruses, e.g. herpes simplex type 1 (HSV-1) and type 2 (HSV-2), varicella zoster (VSV), Epstein-Barr (EBV), cytomegalovirus (CMV), human herpesvirus 6 (HHV-6) and 7 (HHV-7). In addition, the inhibition of herpesvirus growth or replication may indirectly forestall the progression of events from HIV exposure to the clinical manifestation of AIDS. It may also be useful in the detection, diagnosis and manipulation of herpes virus. See also AAQ23764-Q23788 and AAQ24014-
                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transcriptional control recognition element recognition sequences may be recognised by control proteins and are involved in either enhancing or repressing transcription of associated sequences. TCR sequences include promoter elements, hormone receptor elements, viral, cellular, liver tissue elements, etc. The sequence represents an exemplary viral and collular element, the adenovirus major late transcription factor. A typical application of the TCRE recognising oligomucleotides is inhibition of viral proliferation. See also AAQ30472-518. (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Adenovirus major late transcription factor element under control of TCRE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a recombinant adenovirus comprising a genome with a deficiency in the El region and a mutation in the major late promoter (MLD), so that the MLP is less active within a cell other than a packaging cell. The recombinant adenoviruses are highly useful in biological research. They can be used to study viral molecular genetics and cytotoxicity, and to investigate the cell biology of viral growth and infection. They can also be used to investigate molecular and cellular biology of gene expression and regulation in novel genetic backgrounds, e.g., interaction of gene products, ability of transcription factors to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Adenovirus Ad5 major late promoter (MLP) upstream promoter element (UPE).
                                                                                                                                                                        The sequences (AAQ52923-Q53037) are pref. herpes simplex virus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) transregulate gene expression via promoter, or enhancer elements transfer whiches, e.g., to introduce transgenes are also useful as gene transfer whiches, e.g., to introduce transgenes into tissues or cells, and may thus be used as gene therapy vectors. The recombinant adenoviruses can be grown without the presence of DNA complementary to the wild type adenoviral MLP, substantially reducing the probability for generating replication competent adenovirus (RCA). In addition, because the viruses have a MLP which greatly attenuates Li-LS gene expression in nonpermissive host cells, they are less able than first generation vectors to express late viral gene products in a host cell. Sequences AAZ5957-Z59960 represent promoter elements of the MLP of adenovirus secotype 5 (Ad5). The present sequence represents the upstream promoter element (UPB), which is located 63 by upstream of the transcriptional

This sequence represents a fragment of a plasmid expressing a fusion construct encoding a fusion protein having a ubiquitin monomer linked to a protein of increast. The invention relates to a method for enhancing production of a desired protein in a plant or plant cell by inserting a nucleic acid (NA) encoding a ubiquitin monomer upstream of a NA encoding and expression is not controlled by the ubiquitin promoter. The invention and expression is not controlled by the ubiquitin promoter. The invention also relates to a NA acid vector a NA vector able to transform a plant cell, that comprises NA encoding a fusion protein having a ubiquitin monomer linked to a protein of interest and further, where expression of the fusion construct is not under control of a ubiquitin promoter. The construct allows enhanced production of the desired protein in plants or Production of desired protein in plants or plant cells by linking a ubiquitin monomer coding sequence upstream of the gene encoding the Example 2; Page 20; 42pp; English. desired protein.

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09989, ABE00010-ABE99989, ABE00010-ABE99989, ABE00010-ABE99989 and ABI00010-ABE92073 represent the oligomers described in the invention. NOTE: The sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 texpresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABF00010-ABF9989, ABF00010-ABF9989, ABF00010-ABF9989, and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but they wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 88; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invantion describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardity as a system, cardity acut may metholic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oligonuclectide primer SEQ ID NO 304734 for detecting SNP TSC0021079.
                                                                  Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Set of oligonuclectides, useful for diagnosis and cell typing, is designed to detect single-nuclectide polymorphisms and cytosine

                 range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABF00010-ABF99989, ABF00010-ABF99989, ABF00010-ABF99989, ABF00010-ABF99989, and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fitted specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. AGC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and excessime methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABH00010-ABH99889 and ABI00010-ABH2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
Oligonucleotide primer SEQ ID NO 329723 for detecting SNP TSC0035111.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polyamide-oligonucleotide derivative; anticancer; antiproliferative; antiviral; hepatotropic; vasotropic; antisense inhibition; ribozyme; integrin; cell-cell adhesion; cancer; restenosis; stability; PNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.

This invention describes novel polyamide-oligonuclectide derivatives (I) and their physiologically acceptable salts of formula F([DNA]-Li) q(PNA-Li) at CNA-Li) a(PNA]-Li) xF where q, r, s, t = 0 or 1, with the sum of two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid (such as DNA or RNA or their known derivatives); Li = covalent linkage at Obetween DNA and PNA, i.e. a bond or a residue containing at least one nucleobase different from thymins, and F. F' = and groups and/or are connected through a covalent bond. The products of the invention have anticancer, antiproliferative, antiviral, hepatotropic and vasocropic activity and can be used for the inhibition of gene expression by antisanse, ribozyme, sense, or triple-helix methods, or by binding to proteins (aptamers). (I) are used for treating diseases caused by viruses (human immune deficiency, herpes simplex, influenza, vesicular stemmatitis, hepatitis B or papilloma), or mediated by integrins or cellance the target is amplified before being detected by hybridization, for cellandsenous or homogeneous assays, as primers or probes, particularly corrected being detected by hybridization, for the increased affinity for complementary strands and better stability in the attended of genetic, malignant or pathogen-related diseases. (I) retain the disadvantages, i.e. have improved cellular uptake, do not aggregate in aqueous solution, and have reduced affinity for purification contined and produced active than either DNA or PNA oligomers. When used as probes, (I) showed active than either base-pair mismatches in the DNA and PNA. The convenient all mismatches in the DNA and pnonses of segments, all parts the all the and produced active than either by an entire pair mismatches in the DNA and pnonses or probes, and the parts of the par
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pathogenic conditions such as the transition from proto-oncogene to chooceded, also, when used as primers, with the PNA segment at the 5'-end, they produce amplicons resistant to 5'-exonuclease, allowing this enzyme to be used to eliminate RNA or DNA primers. The DNA component allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               additional reactions not possible with PNA alone, e.g. 3'-tailing and (I) may be incorporated into a gene. AAH49208-AAH49264 represent oligonuclectides used to illustrate the method of the invention
New DNA-peptide nucleic acid chimeras, useful e.g. as antisense agents for treating e.g. cancer, also as diagnostic probes and primers.
                                                                                                                                                                                                               Example 43; Page 46; 54pp; German.

This invention describes novel polyamide-oligonuclectide derivatives (I) and their physiologically acceptable salts of formula F([DNA]-Li) Q(PNA-Li) and their physiologically acceptable salts of formula F([DNA]-Li) Q(PNA-Li) and F(PNA]-Li) xF where q, r, s, t = 0 or 1, with the sum of two or more adjacent letters at least 2, x = 1-20, DNA = nucleic acid (such as DNA or RNA or their known derivatives); Li = covalent linkage containing at least one nucleobase different from thymine; and F, F' = atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure containing at least one nucleobase different from thymine; and F, F' = containing at least one nucleobase different from thymine; and F, F' = and groups and/or are connected through a covalent bond. The products of the invention have anticancer, antiprollferative, antiprient of gene containing at least one nucleobase different from thymine; and F, F' = and groups and/or are connected through a covalent bond. The products of the invention have antiense, riboxyme, sense, or triple-helix methods, or by binding to proteins (aptamers) (I) are used for treating diseases caused by viruses (human immune deficiency, herpes simplex, influenza, vesicular stomatitis, hepatitis B or papilloms), or mediated by integrins or cell-cell adhesion reactions, for treating cancer, or for inhibiting createnosts, particularly as antisense reagents. They are also useful in heterogeneous or homogeneous assays, as primers or probes, particularly where the target is amplified before being detected by hybridization, the increased affinity for complementary strands and better stability in serum, associated with conventional peptide nucleic caids (PNA), but lack the disadvantages, i.e. have improved cellular uptake, do not aggregate in aqueous solution, and have reduced affinity for purification continued and nave reduced affinity for purification continued and nave the reagent meaning and non-active than either DNA or PNA oligomers per particular production of the control of the prod
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 additional reactions not possible with PNA alone, e.g. 3'-tailing and (I) may be incorporated into a gene. AAH49208-AAH49264 represent oligonucleotides used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oncogene, also, when used as primers, with the PNA segment at the 5'-end, they produce amplicons resistant to 5'-exonuclease, allowing this enzyme to be used to eliminate RNA or DNA primers. The DNA component allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This invention describes novel polyamide-oligonuclectide derivatives (I)
and their physiologically acceptable salts of formula F((DNA)-Li)_g(PNA-Li)_s (SNA)-Li)_LxF' where q, r, s, t = 0 or 1, with the sum of
two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
c two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
c two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
c two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
c stom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure
c atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure
c containing at least one nucleobase different from thymine; and F, F' =
c end groups and/or are connected through a covabent bond. The products of
c the invention have anticancer, antiproliferative, antiviral, hepatotropic
c and vasotropic activity and can be used for the inhibition of gene
c expression by antisense, ribozyme, sense, or triple-helix methods, or by
c binding to proteins (aptamers) (1) are used for treating diseases caused
c by viruses (human immune deficiency, herpes simplex, influenza, vesicular
c scomatitis, hepatitis B or papilloma), or mediated by integrins or cell-
c cell adhesion reactions, for treating cancer, or for inhibiting
c restenosis, particularly as antisense reagents. They are also useful in
c restenosis, particularly as antisense reagents or probes, particularly
c where the target is amplified before being detected by hybridization, for
diagnosis of genetic, malignant or pathogen-related diseases. (1) retain
c the increased affinity for complementary strands and better stability in
                                                                                                                                                                            ö

When used as probes, (I) show different responses to base-pair mismatches in the DNA and PNA segments, allowing better discrimination between pathogenic and non-pathogenic conditions such as the transition from proto-oncogene to oncogene, also, when used as primers, with the PNA segment at the 5'-end, they produce amplicons resistant to 5'-exonuclease, allowing this enzyme to be used to eliminate RNA or DNA primers. The DNA component allows additional reactions not possible with PNA alone, e.g. 3'-tailing and (I) may be incorporated into a gene. AMH49208-AMH49264 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             may be incorporated into a gene. Also described is the DNA
                                                                                                                                                                        The present invention relates to protective sequence proteins (ABB44624-ABB44830) and their coding sequences (ABA82701-ABA82937). The sequences, when introduced into a cell either predisposed to undergo cell death or in the process of undergoing cell death, prevent, delay or rescue the cell from death, hence, these sequences are named "protective sequences". The sequences are useful for treating and/or ameliorating cancer, autoimmune diseases and neurological disorders e.g. stroke. Further examples of diseases which may be treated by the present invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            dominant optic atrophy (ADOA)) polypeptides and the OPA1 gene, useful in the diagnosis and treatment of autosomal dominant optic atrophy ADOA.
                                                                 New protective sequences and their products, useful for diagnosing and treating diseases involving cell death, including neurological disorders e.g. stroke and for identifying modulators of expression of the protective sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human normal or mutant OPA1 (the predominant locus for autosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ophthalmological; OPA1; autosomal dominant optic atrophy; ADOA;
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention. (Updated on 29-AUG-2003 to standardise OS field)
(II) encoding (I). (I) and (II) are useful as a medicament, for the treatment of a medical condition resulting from a defect in the OPA1 gene, which results in autosomal dominant optic atrophy. The nucleic acid and antibodies to (I) are useful in a variety of hybridisation and immunological assays to screen for, and to detect the presence of, either a normal or a defective OPA1 gene or gene product. ABK72533-ABK72593 represent the human OPA1 gene and intron/exon splice junctions
                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention describes a novel nucleic acid containing a specific segment having at least one region that modulates expression of the VRI (vanilloid receptor type 1) receptor, or a functional derivative, allele or fragment of this region, or a sequence that hybridises to it under standard conditions. The VRI modulator is derived from one or more of positions 221931-223344 of GenBank AL670399, 31673-36359 of AL663116, or 44731-43211 or 36616-33151 of AF168787 and is involved in transmission of pain, particularly in primary sensory neurons. The invention also describes a vector that contains the VRI modulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulating expression of the VRI receptor by introducing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid that modulates expression of the vanilloid receptor-1, useful for control of pain or sensitivity disorders, comprises sequences from control regions of the receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ds; VR1 receptor; vanilloid receptor type 1; modulator;

                                                                                                                    The invention comprises the amino acid and coding sequences of SLC26A6, SLC26A1 and SLC26A2 anion transporter proteins. The DNA and protein sequences of the invention are useful for treating cancer. The present DNA sequence represents a splice site from the gene encoding the mouse SLC26A6 anion transporter protein.
                                          New SLC26A6, SLC26A1 or SLC26A2 polypeptide, useful for preparing
                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to peptide nucleic acid (PNA) derivatives. These can be used in the treatment of cancer, viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is an oligonucleotide fragment of a PNA described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                            New peptide nucleic acid derivatives, useful e.g. for treating tumors and diagnosis, have N-terminal phosphoryl residue for improving e.g.

modulator or the vector into a cell that contains the VRI gene. The products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded oligonucleotide fragment of it), e.g. by Western blotting or enzyment of it), e.g. by Western blotting or enzyment of associated with overexpression or diseases associated with overexpression of the transcription factor. The region that modulets VRI receptor expression includes a binding site for a transcription factor, e.g. MZF1, NFkappaB, NFAT or GATA1. The nucleic acids of the invention, or vectors containing them, sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and myalgia, that are associated with activity of the VRI receptor. This sequence represents a fragment of rat VRI exon id DNA which is capable of binding to a transcription factor.

Novel platinum-zinc complex useful as agent for controlling expression of promoter sequence or RNA of specific gene for treatment of cancer.

Example 4; Page 10; 21pp; Japanese.

The invention relates to a novel platinum-zinc complex (C1) used in the regulation of gene. expression. The complex of the invention is prepared by reacting a 2.2 -bipyridyl derivative and a cyclen derivative protected by t-butoxycarbonyl (Boc), adding the platinum compound to the obtained complex. (C1) is useful as an agent for controlling the expression of a specific gene. This involves contacting (C1) with the nucleic acid sequence of the gene, where the nucleic acid sequence of the gene, where the nucleic acid sequence which controls the expression of the gene. or an RNA encoding the gene. The platinum complex in (C1) has increased anti-tumor activity with respect to solid tumors such as testicular tumors, ovarian cancer, head and neck cancer, esophageal cancer and small cell lung carcinoma. (C1) controls the gene expression by the combination of zinc and platinum complex in its structure. The current sequence represents a promoter

AAV63047-V63052 are oligonucleotide primers used in a novel method for sequencing biopolymers with mass spectrometry. The method involves sequencing tibonucleic acids (RNA), nucleic acids (DNA), peptides or oligosaccharides by digestion of the RNA or DNA or peptides or oligosaccharides by digestion of the RNA or DNA or peptides or oligosaccharides direction of the RNA or DNA or peptides or oligosaccharides direction of the separation and detection of the pecifically cleaving compounds. The separation and detection of the segments produced takes place following by mass spectrometry, primarily MALDI (matrix-assisted laser desorption ionisation), and various peak intensities, produced by enzymatic or chemical hydrolysis of the corresponding individual bonds, the mass spectra are enlisted for the intensities of the sequence data. The method is useful for detecting or identifying organisms by DNA or RNA 'fingerprinting' or 'foot printing' or for determining the secondary structure of biopolymers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for sequencing an unknown DNA molecule which comprises selecting a library primer from an octamer origonucleotide library consisting of 48 b-tp sequences and corresponding complementary sequences, where the library primer is complementary to a known sequence adjacent to the unknown sequence or is complementary to a sequence in a known extension product. The method is useful for DNA nucleotide sequencing, in PCR, and in other processes which make use of primers. The octamers are used to identify coding sequences. Primer walking using the octamer libraries is advantageous over other sequencing methods because it does not require multiple cloning steps nor subsequent template preparations, and it is a directed and methodical approach.

AAA$0688_A81253 represent the octamer primers used in the primer walking

equencing biopolymers with mass spectrometry. The method involves sequencing ribonucleic acids (RNA), nucleic acids (DNA), peptides or oligosaccharides by digestion of the RNA or DNA or peptide or cligosaccharides grands and comprises the strands being investigated being treated with specific exo-fendonucleases, -peptidases, -carboxyesterases, -amidases or -glycosidases or other sequence- or base-specifically cleaving compounds. The separation and detection of the specifically mainly individual bonds, the mass spectra are anlisted for the corresponding individual bonds, the mass spectra enablisted for the cinterpretation of the sequence data. The method is useful for detecting or identifying organisms by DNA or RNA 'fingerprinting' or 'foot printing' or for determining the secondary structure of biopolymers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                              AAV63047-V63052 are oligonucleotide primers used in a novel method for sequencing biopolymers with mass spectrometry. The method involves sequencing tibonucleic acids (RNA), nucleic acids (DNA), peptides or oligosaccharides by diseation of the RNA or DNA or peptides or oligosaccharides by diseation of the RNA or DNA or peptides or oligosaccharide strands and comprises the strands being investigated carboxyseterases, -amidases or -ejhoconideases or other sequence or basespecifically cleaving compounds. The separation and detection of the specifically cleaving compounds. The separation and detection of the specifically cleaving compounds. The separation and detection of the intensities, produced by enzymatic or chemical hydrolysis of the corresponding individual bonds, the mass spectra are enlisted for the corresponding individual bonds, the mass spectra are enlisted for the interpretation of the sequence data. The method is useful for detecting or identifying organisms by DNA or RNA 'fingerprinting' or 'foot printing' or for determining the secondary structure of biopolymers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
The invention relates to a double stranded short interfering RNA (siRNA) molecule that inhibits expression of epidermal growth factor receptor (EGFR) gene (e.g. HER1-4) by RNA interference is new. Also included is an expression vector comprising a nucleic acid sequence encoding siRNA molecule (s) in a manner that allows expression of the nucleic acid molecule (s) in a manner that allows expression of the nucleic acid molecule straymes and DNAzymes. The siRNA molecules comprise harmerhead ribozymes, inozymes expression of EGFR. It can be used for treatment of cancer, prostate cancer, colorectal cancer, brain cancer, cervical cancer, stomach cancer, ovarian cancer, pancreatic cancer, cervical cancer, head and neck cancer ovarian cancer, melanoma, lymphoma, glioma, multidrug resistant cancer or a brain tumour. The invention has enhanced shelf-life, half-life in vitro, stability, and ease of introduction of oligonucleotide to target site. The present sequence is an EGFR/HER1-4 target sequence for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The 5'-primers all contain equal numbers of G+C and A+T nucleotides. The 288 (or more) combinations of 5'- and 3'-primers are used in PCR amplifications as part of a method for diagnosing gene expression. The amplified fragments are separated by non-denaturing PAGE and the band pattern is compared to a standard. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

camplified polymorphic DNA (RAPD) reaction primers used in a random comprise used to isolate the sequence represented by AAT35706 for sequences were used to isolate the sequence represented by AAT35706 for use in the diagnostic assays of the invention. The qualitative assays of the invention comprises analysing a sample for the presence of the sample convention comprises taking a sample for the presence of the sample is infected by V.dahliae sequence in the sample convention, comprises taking a sample and isolating nucleic acids from it. A sequence that acts as an internal standard (see AAT35707) is added to the isolated nucleic acids. The internal standard competes with the convention, comprises taking a sample and isolating nucleic acids from the isolated nucleic acids. The internal standard (see AAT35707) is added to the internal standard sequence for the PCR primers used in the reaction (such as the sequences represented by AAT35708 and AAT35709). The amplified portion of the internal standard is a different size to the amplified portion of the internal standard is a different size to the amplified portion of the internal field that is going to be used for growing potatoes. These assays are faster and more accurate than methods based on culturing soil samples in selective media. The assays can also distinguish between convolution can be avoided
                                                                                                                                                                    RAPD; random amplified polymorphic DNA; diagnostic assay; quantitative; PCR; primer; qualitative; soil sample; agricultural field; potatoe; V.albo-atrum; soil fumigation; amplify; polymerase chain reaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assay for Verticillium dahliae - by amplification of specific DNA

This sequence represents a binding site identified using the method of the invention. This sequence was identified using the 32P-labelled of onlygonucleotide duplex shown in AAT76581 and the primers shown in AAT76582 and the method of the invention. The method is for shultaneously isolating protein-binding sites for DNA-binding proteins. The method comprises: (a) mixing a set of oligonucleotide (ON) duplexes having 5' and 3' sequences capable of annealing to primers for amplification and an internal sequence having a potential protein-binding proteins; (b) separating unbound ON duplexes from ON duplexes complexed with the DNA-binding proteins; (c) amplifying complexed duplexes to form amplified duplexes; thereby isolating protein-binding sites for the DNA-binding proteins. The methods can be used to identify protein-binding sites which can be used to identify corresponding DNA-binding proteins in an expression library. They can also be used to develop products to inhibit the function of a given DNA-binding protein or for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CAG repeat; human; genome analysis; adapter primer; medical diagnostic; nucleic acid analysis; variation assessment; neurological disease; Huntington's chorea; PCR suppression; ss.

This sequence represents an adapter primer oligomucleotide. It was used to isolate CAG repeat containing sequences from the human genome to test to isolate CAG repeat containing sequences from the human genome to test the method of the invention. The method is for analysing nucleic acids in a sample, and comprises: (a) providing a sample containing nucleic acid, a first oligomucleotide primer comprising a CAG repeat and a polymerase and PCR cagentis, (b) preparing said nucleic acid so that it is amplifiable; (c) amplifying the nucleic acid with the first and second primers; and preparing the nucleic acid with the first and second primers; and (d) detecting the amplified product. The method is used to distinguish cotween the expression of genes in two or more biological samples, e.g. body fluids, cells, solid tissue or solid and liquid foods. It can be used in medical diagnostics, e.g. to differentiate between normal and diseased tissue or to assess the variation within menozygotic twin pairs. The method allows the isolation and analysis of genome subsets containing CAG repeats which are known to be important in a number of neurological diseases including Huntington's chorea. The method uses PCR suppression, any which any various cell types. Genome complexity is reduced by expressed genes in various cell types. Genome complexity is reduced by the new method which targets genomic subsets containing CAG repeats
                                                                                                                                                                                                                                                                    Analysing nucleic acid samples - using amplification primers which contain CAG or CTG tri:nucleotide repeats for differential display of samples from different sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This random 10-mer primer was used with an oligo-dT primer (see AAT99552) in an RT-PCR amplification of rat embryo fibroblast REF-112 cell RNA. This was performed in order to identifying p53 regulated genes. One transcript that was upregulated specifically in cells harboring wild-type p53 protein was characterised. A previously known gene, mEH (microsomal epoxide hydrolase), was identified. 2 Novel cell growth regulatory genes, CGRII (see AAV04008) and CGRI9 (see AAV0410), were also isolated. These genes and the novel CGRI1 and CGRI9 growth regulatory proteins (see AAW38423 and AAW38425) can be used in methods for the diagnosis and
                                                                                                                     DNA encoding mammalian growth response protein CGR11 or CGR19 - useful to suppress or diagnose cancer, also similar use of SM20 or mEH protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HPPD; barley; hydroxyphenylpyruvate dioxygenase; plant; transformation; transgenic; plant cell; callus tissue, protoplast; electroporation; particle bombardment; soya; barley; wheat; oilseed rape; maize; primer;

              especially where an expression cassette is introduced into a plant cell, callus tissue, a whole plant or protoplasts by Agrobacterium tumefaciens transformation, electroporation or particle bombardment and where the plants are selected from soya, barley, wheat, oilseed rape, maize and sunflower, or where the DNA is expressed in tobacco plants, especially in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a primer of the invention. The invention relates to eguences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma) **delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; A = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptides having at least two new nucleotides - useful as primers in RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa

The specification describes a for treating viral infection or reactivation. The method comprises contacting an individual with a compound which is an antagonist of the reaction between the origin binding protein Binding site III sequence from Herpes simplex virus (HSV) and HSV-2 and interferon regulatory factor-1 (IRP-1). Alternatively, the compound lowers the level of IRP-1, TIS7, interferon (IFN)-alpha, or IFN-beta. The method can be used to treat viral reactivation in HSV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression;

Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell cother transcripts and subsequent recognition by T-cell receptors is alone in subsequent recognition by T-cell receptors is alone in multiplicate a robust cytocxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

         diagnosis, prognosis and monitoring of diseases related to abnormal expresseion of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a topolulation of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen and presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8AGB tag, serial analysis of gene expression; antigen-presenting cell; APC; monocyte-darived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences ALST 1992-1993 represent State animals and sequences and tages used to identify manh transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be correspond to novel genes. Antigen-presenting cells check transcripts correspond to novel genes. Antigen-presenting cell check transcripts correspond to novel genes. Antigen-presenting cell correspond to novel genes. Antigen-presenting cell correspond to presentation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation by T-cell receptors is alone to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic Tlymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of diseases related to abnormal capression of these genes. Detection of the dendritic cell differentially expressed genes in expressed genes, or of their encoded proteins can be used to identify can be used in active immunocherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing and containing and page and a persential and can be used in active immunocherapy can be used to antigen and antigen-specific effector cells) and vectors containing and containing and active immunocherapy can be used an engage and antigen specific effector cells and vectors containing and antigen minimater protects and antigen and antigen specific effector cells and engage cells 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bites,

that are preferentially transcribed in the metastatic breast tumour cells). AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

          Alzheimer-associated beta-amyloid binding protein; BRAB; mouse;
Leydig cell; differential display RT-PCR; DDRT-PCR;
short chain alcohol dehydrogenase; SCAD; testis; marker; spermatogenesis;
                                                                                                                                                                                                                                                                                                                                                                       This sequence represents decamer D24, which was used in a novel differential display RT-PCR (DDRT-PCR) method of detecting genes expressed in tissues, especially mutant tissue. RNA isolated from adult male w/ww azoospermic mutant mice testis was subjected to reverse transcription. 324 PCRs were performed on the resulting cDNA using 3 clamp primers (see Z3467-69) and variable decamer 5' primers D1-D26 (see AAZ34670-95). Differentially expressed clones were used as probes in northern hybridisation, and a novel gene product that was preferentially upregulated in w/ww mouse testis was identified and termed Alzheimerassociated beta-amyloid binding protein (ERAB, see AAZ32239)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps
                                                                                                                                                                                                                                                                                                     Novel differential display reverse transcription PCR method used to detect genes expressed in mutant tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein binding sequence; DNA binding factor; protein inactivation; protein selection; ss.

                                                                                                                                                                                                                                                         The present sequence is a randomly generated binding site sequence, which has been shown to be similar to the sequence which binds to the Pit-1 transcription factor. This was used to demonstrate the invention, which comprises a method for simultaneously selecting those sequences which bind to different DNA-binding proteins. These sequences can then be analysed and used to identify other DNA-binding proteins, as well as being used to inactivate or specifically select particular proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotide comprising novel single nucleotide polymorphisms in human interleukin-4 gene for use in studying expression, function of interleukin-4, in developing drugs, diagnosis and treatment of immune disorders.
                                                                                                                                                        Identifying and isolating binding proteins, and nucleotide recognition sequences for DNA-binding proteins by mixing oligonucleotide sequences comprising randomized internal sequences with a DNA-binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; interleukin-4; IL4; single nucleotide polymorphism; SNP; atopy; inflammatory disorder; immune disorder; population diversity; paternity test; forensic test; cytokine; chromosome 5q31.1; probe; PCR primer; ss.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1;
                                                                                                                                                                                                                                                                    ö
The present invention provides the protein, cDNA and gene of human interleukin-4 (IL4). The coding sequences for this protein contrain single nucleotide polymorphisms (SNPs) which may be associated with differences in susceptibility to atopy, inflammatory and immune diseases and different drug responses. They may also be used in applications such as foremsic and paternity testing and studying population diversity and anthropological lineage. The IL4 gene is found on human chromosome 5q31.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                    Gaps

and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a west cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle and for identification of antifungat drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primars used in the SAGE method, in the exemplification of the present invention

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 348; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, to ronannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for

```
comprising human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a continuous proprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used contacting and arkers of phases of the cell cycle. The cutory, monitor and affect phases of the cell cycle. The control of the contaction of an arkers of phases of the cell cycle. The control of the contaction of an arkers of phases of the cell cycle. The cycle and for identification of antifungal drugs. AAP33268 to AAP44064 crepresent SAGE tags used in the exemplification of the present invention.

Characteristic and contaction of the present invention.

Example 1; Page 62; 213pp; German.

The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analgesic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B, ABB8506-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for

The present invention relates to novel single nucleotide polymorphisms ($NPs) in the human cholinergic receptor, muscarinic 4 (CHRM4) gene ($NPs) in chromosome lip12-p11.2, and methods for haplotyping and/or genotyping the CHRM4 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the CHRM4 gene polymorphisms. The polymorphisms of diseases associated with CHRM4 activity, such as Alzheimer's disease and other neurological disorders. ABK92576-ABK92587 represent primer-extension oligonucleotides for detecting human CHRM4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genetic variants of cholinergic receptor muscarinic 4 useful in ing expression and function of protein, and for screening drugs to diseases e.g. Alzheimer's disease and other neurological disorders
                                                               Primer-extension oligonucleotide #8 to detect human CHRM4 polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, paraoxonase 1; PON1; single nucleotide polymorphism; transgenic; SNP; drug screening; organo-phosphorous metabolism; target validation; atherosclerosis; type II diabetes; gene therapy; antilipaemic; primer;

Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL41627 to ABL4226 represent specifically claimed human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a human maturation/activation dendritic

(PON1) gene. It also relates to the single nucleotide polymorphisms (SNP) in PON-1 gene. Polymorphic variants of the PON1 gene are useful in studying the expression and function of PON1, and in expressing PON1 proteins for use in screening candidate durys to treat diseases associated with PON1 activity, e.g. disorders of lipid and organophosphorous metabolism such as atherosclerosis or type II diabetes. They pair of an individual is useful for improving the efficiency and reliability of several steps including target validation, in the place of a discovery and development of drugs for treating diseases associated with PON1 activity. Transgenic animals are useful for studying expression of the PON1 isogenes in vivo. The present sequence is a primer used to detect human PON-1 gene polymorphisms
                                                                                                                                                                                                                                                 New genetic variants of human paraoxonase 1 (PON1) gene with polymorphisms, useful for treating disorders associated with PON1 isogene activity e.g. atherosclerosis or diabetes, or for screening drugs for
                                                                                                                                                                                                                                                                                                                                                                         The invention relates to methods for haplotyping human paraoxonase 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; 5-hydroxytryptamine receptor 5A; HTR5A; serotonin; primer; neuroprotective; neurological disease; depression; epilepsy; PCR; gene therapy; single nucleotide polymorphism; haplotype pair;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human HTR5A gene allele-specific oligonucleotide PCR primer #40.

The invention relates to single nucleotide polymorphisms in the gene encoding human 5-hydroxytryptamine (serotonin) receptor 5A (HTR5A). A method for haplotyping the HTR5A gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the HTR5A applotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair in a population exhibiting the frequency of the haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a population of the frequency of the haplotype or haplotype pair in a reference complicated that is associated with the haplotype or haplotype pair. HTR5A and its corresponding DNA are used for studying the expression and function of HTR5A activity, such as neurological disorders, including depression and epilepsy. Sequences hBK72399-ABK7238 represent allele-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; pro-platelet basic protein; PPBP; metabolic disorder; immunological disorder; SNP; single nucleotide polymorphism; ss; immunomodulator; chromosome 4q12-13; primer extension oligonucleotide.
                                                                                                  Novel genetic variants of 5-Hydroxytryptamine (Serotonin) Receptor 5A isogenes, useful for improving efficiency and reliability in drug development for treating neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human pro-platelet basic protein DNA primer extension oligo #12.

New Pro-Platelet Basic Protein (PPBP) gene polymorphic variants, useful for studying the expression and function of PPBP and screening candidate drugs for treating disorders associated with PPBP activity, e.g. immunological disorders.

Claim 15; Page 13; 68pp; English.

The present invention provides the protein, cDNA and genomic sequences of human pro-platelet basic protein (PPBP) and single nucleotide polymorphisms (SNBs) identified therein. The polymorphic variants are useful in studying the expression and function of PPBP, in expressing PPBP protein for use in screening for candidate drugs to treat diseases related to PPBP activity, in studying the effect of the variation on the biological activity of PPBP, and the binding affinity of candidate drugs targeting PPBP for the treatment of disorders associated with PPBP activity, e.g. metabolic and immunological disorders. The present sequence is an allele specific primer extension oligonucleotide for the gene of the invention

comprising determining which of the haplotypes given in the specification defines one or both copies of the individual's pCDH2 gene. The polymorphisms are within a 30244 base pair sequence (ABA05413), fully defined in the specification. The polymorphic variants are useful in studying the expression and function of PCDH2, in expressing PCDH2 protocadharin 2 (PCDH2) polymorphic variants and encoding genes, ful in expressing PCDH2 protein for screening candidate drugs to treat diseases related to PCDH2 activity. Claim 18; Page 14; 127pp; English.

screening for the drugs and reducing bias in clinical trials of the

ö The invention relates to an isolated polynucleotide comprising a sequence which is a polymorphic variant of a reference sequence for the human smoothened Drosophila homologue (SMOH) gene or its fragment, or a polymorphic variant of a reference sequence for a SMOH eDNA or its fragment. A new isolated polypeptide is useful for screening for drugs targeting the polypeptide. A new method is useful for screening for drugs targeting the polypeptide. A new method is useful for identifying an association between a trait such as a clinical response to a drug methods have applicability in developing diagnostic testes and therapeutic treatments for basal cell carcinomas (BCCs). The isolated polynucleotide is useful for studying the expression and function of SMOH and expressing swOH pactivity. The polymorphism and haplotype data are useful for validating whether SMOH is a suitable target for drugs to treat BCCs. protein for use in screening for candidate drugs to treat diseases such as cancer, related to PCDH2 activity, in studying the effect of the variation on the biological activity of PCDH2 and the binding affinity of candidate drugs targeting PCDH2. The haplotyping methods are useful in validating PCDH2 as a candidate target for treating a specific condition or disease predicted to be associated with PCDH2 activity or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with PCDH2 activity. The present sequence is that of a PCDH2 allele-specific oligonucleotide (ASO) PCR primer of New genetic variants of smoothened Drosophila homolog (SMOH) gene useful for therapeutic purposes and for expressing SMOH protein useful in identifying drugs to treat basal cell carcinomas. Cytostatic; polymorphic variant; single nucleotide polymorphism; SMOH; human smoothened Drosophila homologue; basal cell carcinoma; BCC; gene therapy; PCR; primer; 88. ```
The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma in a parameter containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive containing the pregression of glaucoma in a patient, comprising providing an expected in a partient containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising cheatining a sample containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing a nucleic acid regolon containing human genomic DNA, providing and cell acid acid regolon containing human genomic DNA, providing and cell acid acid acid regolon containing human genomic DNA, providing and cell acid acid regolon containing human genomic DNA, providing and cell acid acid regolon containing a solutineut man optineut and analysis of containing a polymorphy and detecting a

The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA

                                                                                                                                                                                                                                      New microarray for measuring gene expression characteristics of hematopoietic cells, useful for preparing a composition for diagnosing or treating myeloid leukemia.
                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a microarray for measuring gene expression characteristics of haematopoietic cells comprising at least 5 bolynucleotides having distinct sequences. Also described are: a method of diagnosing or treating an abnormality associated with haematopoiesis, and diagnosing myeloid leukaemia in a patient. The microarray is useful for preparing a composition for diagnosing or treating myeloid leukaemia. This sequence represents a polynucleotide probe comprising a portion of an expressed gene isolated from a population of CDIS+ myeloid cells and suitable for use in the microarray of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                           The invention relates to a novel method for detecting an individuals genetic disposition to schizophrenia by testing tissue from bodily fluid. The novel method involves detecting the pre Cinnamomun-camphora thorin gene or gene expressed product in the fluid that binds to oligonucleotide, or test substance. The method is useful for detecting tissue in a fluid obtained from a person suffering from schizophrenia. This polymucleotide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                   Detecting tissue in fluid obtained from person suffering from schizophrenia, involves detecting pre Cinnamomum-camphora thorin gene or gene expressed product in fluid that binds to oligonucleotide or test

(A) comprises protein or mRNAs or their fragments. (M1) is
                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                             Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin ichthyosis, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic darmatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or etress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,

ABQ78717-38 represent rRNA gene fragments, which were aligned to enable designing of probes of the invention. The specification describes probes specific for Encephalitozoon hellem, B. cuniculi and B. intestinalis. The probes hybridise to the 16S rRNA gene, and have a marker attached to then. The probes are able to hybridize with mRNA of one species of genus are useful for detecting the presence of Encephalitozoon mitroacon the presence of Encephalitozoon microorganisms. The probes are useful Encephalitozoon hellem, Encephalitozoon cuniculi and Encephalitozoon intestinalis in drinking water
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Probe for detecting Encephalitozoon protozoans e.g. Encephalitozoon cuniculi.

ABK99375 BXBXBXB à containing of ligonarders. (a) the amino acid sequence of a variant of the oestrogen receptor alpha (ESR-alpha) protein in AAG68251; or (b) a fragment comprising at least 10 contiguous amino acids of the protein in AAG68251; or (b) a fragment comprising at least 10 contiguous amino acids of the protein in AAG68251. (1) has cytostatic, osteopathic, cardiant and vascropic activities, and can be used in gene therapy and vaccine production. (l) is useful for identifying an agent that binds to (1), by contacting (1) with an agent and assaying the contacted mixture to determine whether a complex is formed with the agent bound to the peptide. A polymucleotide (II), encoding (1), is useful in the mediated/modulated by an oestrogen receptor (ER). (II) is also useful in gene therapy for treating cancer, osteoporosis and cardiovascular gene therapy for treating cancer, osteoporosis and cardiovascular characters. The human ESR-alpha gene is located on chromosome 6. ABA89869 to charactering cancer by the care alocated on chromosome 6. ABA89869 contactining oligonucleotides, which are used in an example from the ö The present invention describes an isolated peptide (I) consisting of an Novel variant of estrogen receptor alpha polypeptide useful for determining the biological activity of a protein for high throughput screening and for raising antibodies that elicit an immune response in Human; oestrogen receptor alpha; ESR-alpha; ER; chromosome 6; Syne-2; Gaps /standard name= "single nucleotide polymorphism" .. amino acid sequence selected from: abstrace performed:

amino acid sequence selected from: (a) the amino acid sequence of a variant of the oestrogen receptor alpha (ESR-alpha) protein in AAG68251;

or (b) a fragment comprising at least 10 contiguous amino acids of the protein in AAG68251. (I) has cytostatic, osteopathic, cardiant and candrotting (1) is useful for identifying an agent that binds to (1), by contacting (1) with an agent and assaying the contacted mixture to centracting (1) with an agent and assaying the contacted mixture to peptide. A polynucleotide (II), encoding (1), is useful in the complex is formed with the agent bound to the mediated/modulated by an oestrogen receptor (ER). (II) is also useful in the complex of disagnostics and therapies for diseases and disorders and classases. The human ESR-alpha gene is located on chromosome 6. ABA89869 (c) containing oligonucleotides, which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated peptide (I) consisting of an

Novel CYP3A5 polynucleotide useful for diagnosis and treatment of cancer, cardiovascular diseases, diabetes and AIDS, and for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a new CYP3A5 polynucleotide encoding a polypoptide, where the polynucleotide is capable of hybridising to a identifying a invention is useful in an in vitro method for diagnosing a polymorphism. The invention is also useful for useful for diagnosing a disorder related to the presence of a molecular variant of a CYP3A5 or susceptibility to such a disorder, where the disorder is cancer, or diseases including cardiovascular diseases, diabetes and AIDS. The invention can further be used for the preparation of a diagnostic composition for diagnosing a disease in a subject having a genome comprising a variant allele of the CYP3A5 gene, where the subject is an African American. The molecules of the invention are as forensic markers and in pharmacological studies. The present nucleic acid sequence in expresents a human CYP3A5 gene polymorphism reference DNA sequence, as
               Human, CYP3A5, polymorphism; cancer, cardiovascular disease, diabetes,
AIDS, African American; forensic marker; pharmacological, cytostatic,
antidiabetic; anti-HIV; gene therapy, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 11 BP; 4 A; 2 C; 3 G; 2 T; 0 U; 0 Other;

The present invention relates to a new CYP3A5 polynucleotide encoding a polypeptide, where the polynucleotide is capable of hybridising to a CYP3A5 gene. The invention is useful in an in vitro method for dientifying a polymorphism. The invention is also useful for useful for diagnosing a disorder related to the presence of a molecular variant of a CYP3A5 or susceptibility to such a disorder, where the disorder is cancer, or diseases including cardiovascher, where the disorder is composition for diagnosing a disease in a subject having a genome composition for diagnosing a disease in a subject having a genome composition a variant allele of the CYP3A5 gene, where the subject is an African American. The molecules of the invention are as forensic markers and in pharmacological studies. The present nucleic acid sequence
                                                                                                                                                                                                                                                                                                                                                                      Novel CYP3AS polynucleotide useful for diagnosis and treatment of cancer, cardiovascular diseases, diabetes and AIDS, and for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pain transmission, primary sensory neuron, transcription factor, detection, MZF1; NFKappaB; NFAT; GATA1; sensitivity disorder; analgesia; hypalgesia; hypalgesia; meuralgia; myalgia; murine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          represents a human CYP3A5 gene polymorphism reference DNA sequence, as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

rints invention ussettibes a mover indicate concentrally a speciator segment having at least one region that modulates expression of the VRI (vanilloid receptor type 1) receptor, or a functional derivative, allele or frangment of this region, or a sequence that hybridises to it under standard conditions. The VRI modulator is derived from one or more of positions 221331-22334 of Genbank AL670399, 31673-36359 of AL663116, or 4731-43231 or 36616-33151 of AR168787 and is involved in transmission of describes a vector that contains the VRI modulator, host cells containing the world than human germ or embryonal stem cells) and a method tor modulating expression of the VRI receptor by introducing the modulator or the vector into a cell that contains the VRI gene. The products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded colsonicated with overexpression or underexpression of the transcription associated with overexpression or underexpression of the transcription and expending site for a transcription factor. Captonian site for a transcription or vectors containing them, are used for paracon, eagured to the containing them.

Calganulator or the weekpression or underexpression of the transcription captor. The region that modulates VRI receptor expression in the containing them, care used for prevention or treatment of pain, also for treatming them, care used for prevention or treatment of pain, also for treatming them, care used so the invention.
                                                                                                                                                                                                                                                                                                               New nucleic acid that modulates expression of the vanilloid receptor-1, useful for control of pain or sensitivity disorders, comprises sequences from control regions of the receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and myalgia, that are associated with activity of the VR1 receptor. This sequence represents a fragment of murine VR1 exon 1d DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel nucleic acid containing a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          40.0%; Score 8; DB 1; Length 11; 100.0%; Pred. The invention relates to a method of analyzing haplotype, by detecting gene polymorphism in drug-related genes such as aryl acetylamine varialkylamine N-acetyl transferace or Arp-binding cassette, cub-family A (ABC1), member 1. The method is useful for analyzing sub-family A (ABC1), member 1. The method is useful for analyzing configuration or a foreign meterial, for selecting medicine for preventing or treating diseases, for selecting medicine for preventing or treating diseases, for analyzing a drug conficine for preventing or treating a disease, for analyzing a drug conficine for preventing or treating a disease, for analyzing a drug conficine for preventing or treating disease, for analyzing a drug conficine for preventing or treating disease, for analyzing a drug conficine for preventing or treating disease, for analyzing a drug conficine malignant tumor, immune disorder circulatory disease. The diseases include malignant tumor, immune disorder circulatory disease, metabolic disease. The method enables analysis of the individual differences creating each single nucleotide polymorphism. The present sequence

New oligonucleotides are disclosed which are 8-18 nucleotides in length and which have a steroid structure attached to the 3'-end through a linker attached to the A-ring of the steroid skeleton. In particular, the present sequence has a cholesterol moiety attached by its A-ring to to the 3'-phosphate through a carbonyl group attached by its A-ring to to the 3'-phosphate through a carbonyl group attached to the ring nitrogen of a moiety derived from 4-hydroxymethyl- pyrrolidine. The oligonucleotides form stable duplexes at physiological temperature and have selective cytotoxic activity against certain tumour cell lines, including some with multiple drug resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wound healing; non-MRL healer mouse; quantitative trait locus; QTL; healing response; microsatellite marker; treatment; central nerve; peripheral nerve; nerve injury; SAGE tag; murine; ss.
                                                                                                                                    New stable oligo:nucleotide duplex with 3'-steroid gp - including intramolecular duplex with hairpin loop region, having selective cytotoxicity against some tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                             ..

one quantitative trait locus selected from those given in the specification, exhibiting an enhanced healing response to a wound compared to mice (m) without the locus. The invention describes a novel method of identifying a gene involved in enhanced wound healing by identifying DNA microsatellite markers which can distinguish healer mice from non-healer mice and identifying microsatellite markers which each non-healer mice and identifying microsatellite markers which especially charkers which enhanced wound healing in progeny of the mice, where a chromosomal locus containing at least one enhanced wound healing gene is identified. A method of treating a wound in a mammal is also disclosed. The new methods are useful for treating wounds, especially central and peripheral nerve wound. The methods of the invention are useful for restoring function after nerve injury in a mammal. (M) is useful as a mammalian model of enhanced wound healing, useful for identifying genes cand gene products involved in enhanced wound healing, and to provide methods for wound healing. AAZIS61-Z19036 represent murine SAGE tags from C57BL/6 and MRL mice which are used to illustrate the method of the

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal call carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
identifying DNA microsatellite markers which can distinguish healer mice from non-healer mice and identifying microsatellite markers which espergedte with enhanced wound healing in progeny of the mice, where a chromosomal locus containing at least one enhanced wound healing upon the incompleted. A method of treating a wound in a mammal is also disclosed. The new methods are useful for treating wounds, especially central and peripheral nerve wound. The methods of the invention are useful for restoring function after nerve injury in a mammal. (M) is useful as a mammalian model of enhanced wound healing, useful for identifying genes and gene products involved in enhanced wound healing, and to provide methods for wound healing. AAZIB691-Z19036 represent murine SAGE tags from C57BL/6 and MRL mice which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                       In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically schooled from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
